ARCHITECTURE

SELF-HELP CENTER FOR PEOPLE EXPERIENCING HOMELESSNESS

Academic · Adaptive reuse · Wrocław, Poland · Bachelor's project

The Self-Help Center for People Experiencing Homelessness is designed to create an intermediate stage between homelessness and full social reintegration. The project involves the adaptive reuse and restoration of the historic Upper Silesian Railway Station, currently in a state of neglect, which is the oldest railway station building of its kind in Poland.

The proposed site development is inspired by the site's railway heritage. A series of pavilion structures, including food service facilities as well as workshop and craft spaces, are designed in the form of railway carriages.

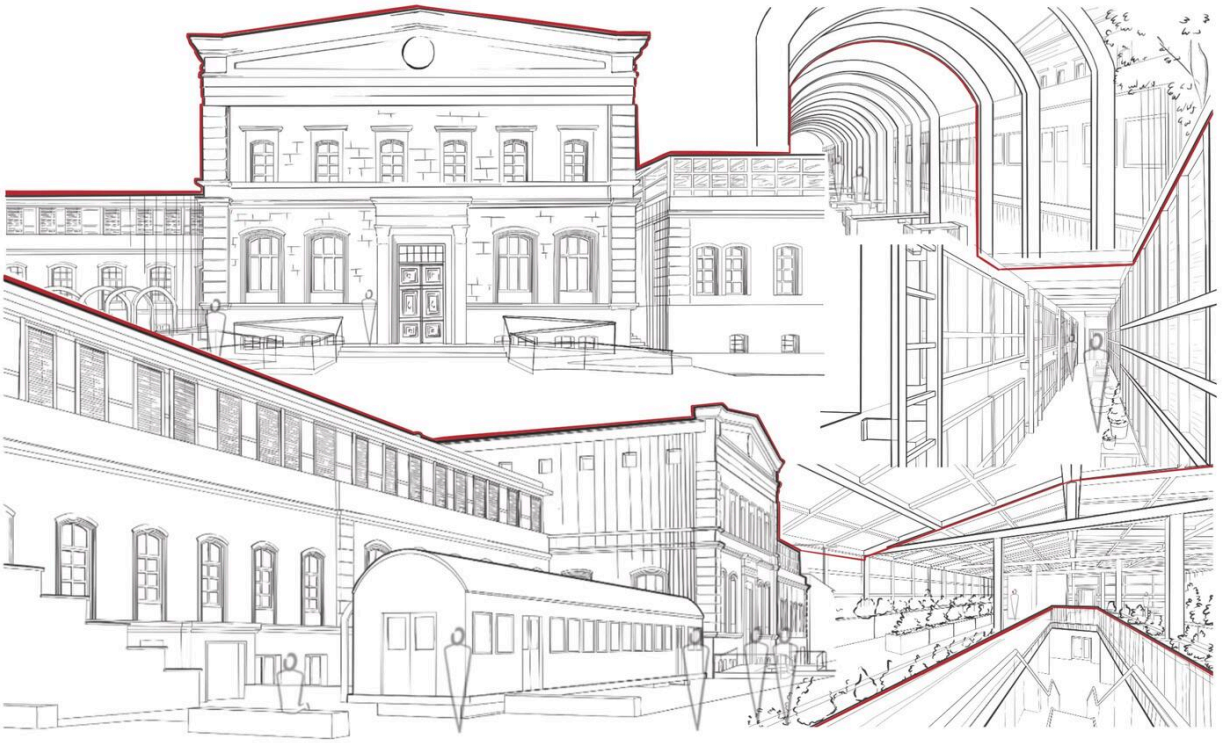

The historic section of the building has been carefully restored and complemented by a contemporary extension. The new addition is intentionally designed not to dominate the existing structure in terms of form, scale, or shape, creating a clear contrast while simultaneously emphasizing the historical value of the monument.

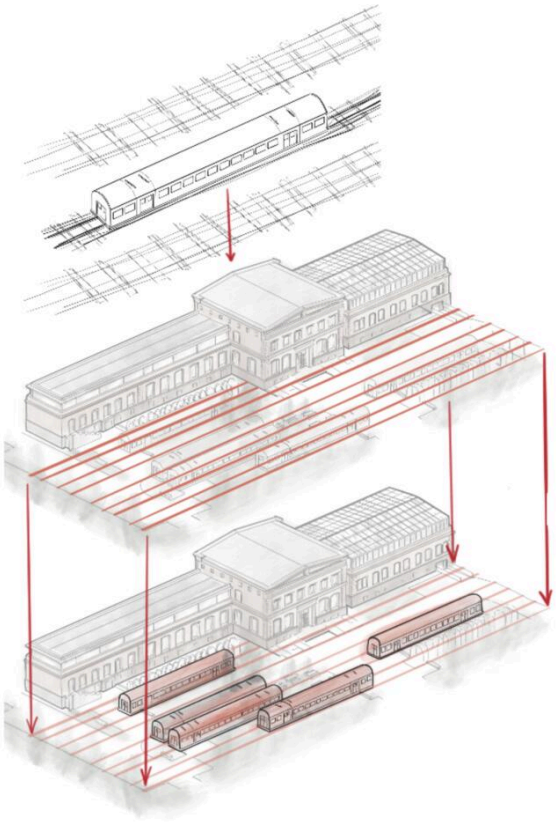

The central nave forms the heart of the social reintegration process. It accommodates shared communal spaces, medical consultation rooms, psychological counselling facilities, social services offices, and bathing facilities.

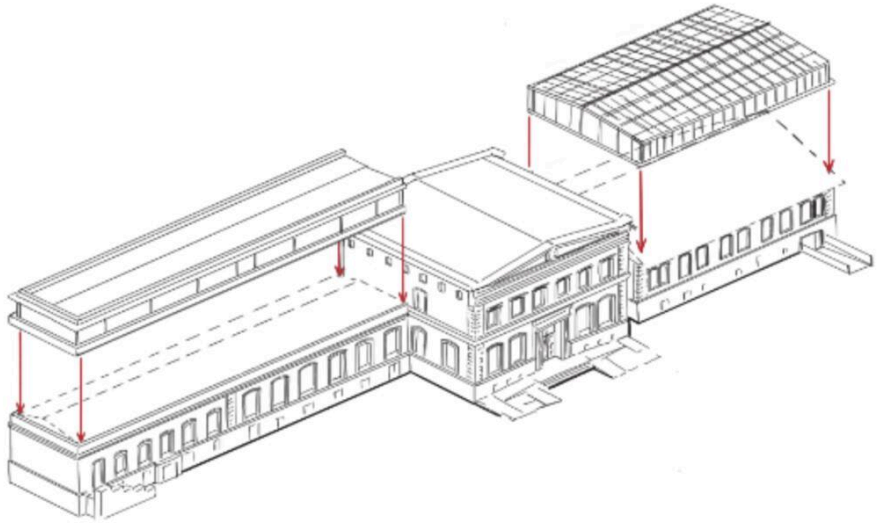

The right nave is designated as the emergency accommodation zone. This area incorporates a system of stacked sleeping pods, providing temporary shelter for people in immediate need.

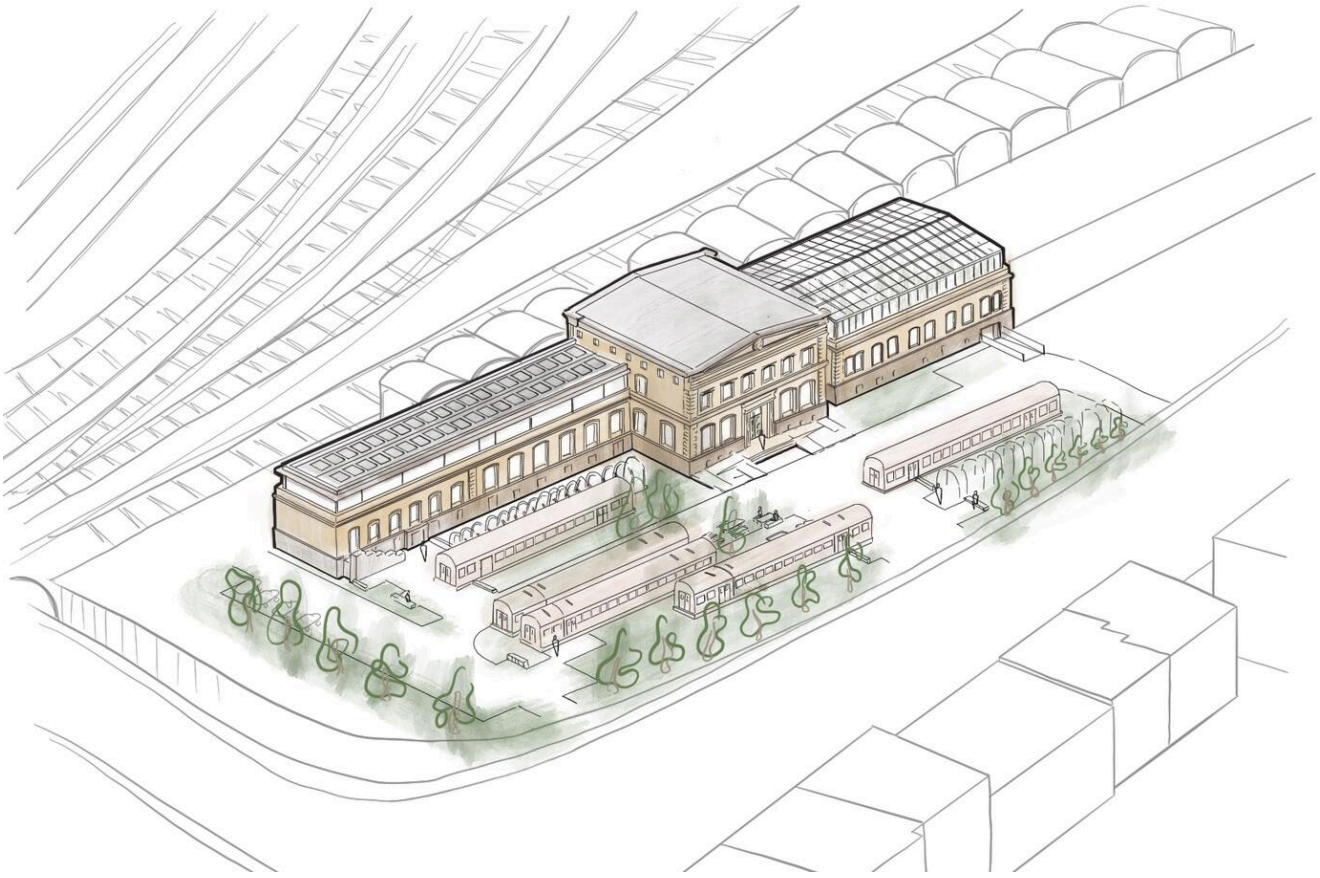

The left nave serves as the residential section, above which a greenhouse is located. The residential units are connected by a large shared kitchen and a communal lounge area. The greenhouse is intended to support the daily operation and partial self-sufficiency of the center while also encouraging residents' engagement through gardening and cultivation activities.

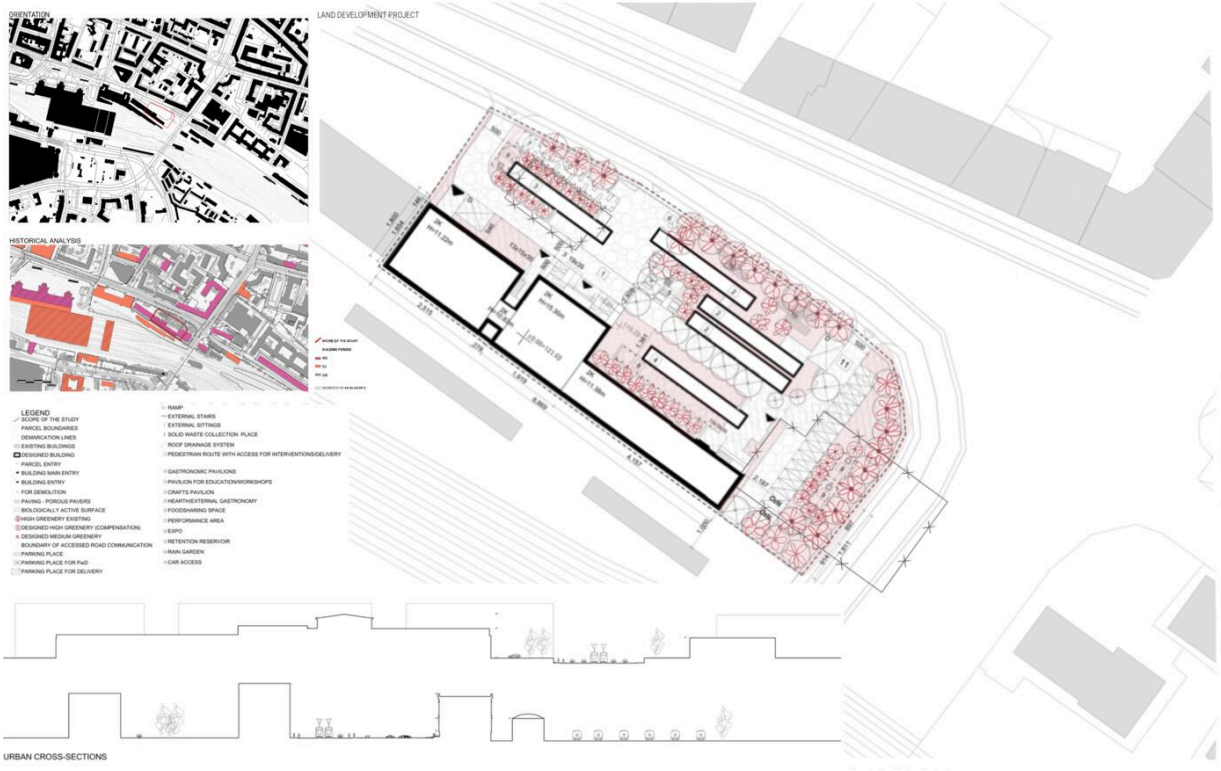

The existing building features a traditional load-bearing masonry structure that has been restored and structurally reinforced with reinforced concrete elements and steel members where required. The newly added upper extension is constructed using timber.

ARCHITECTURE

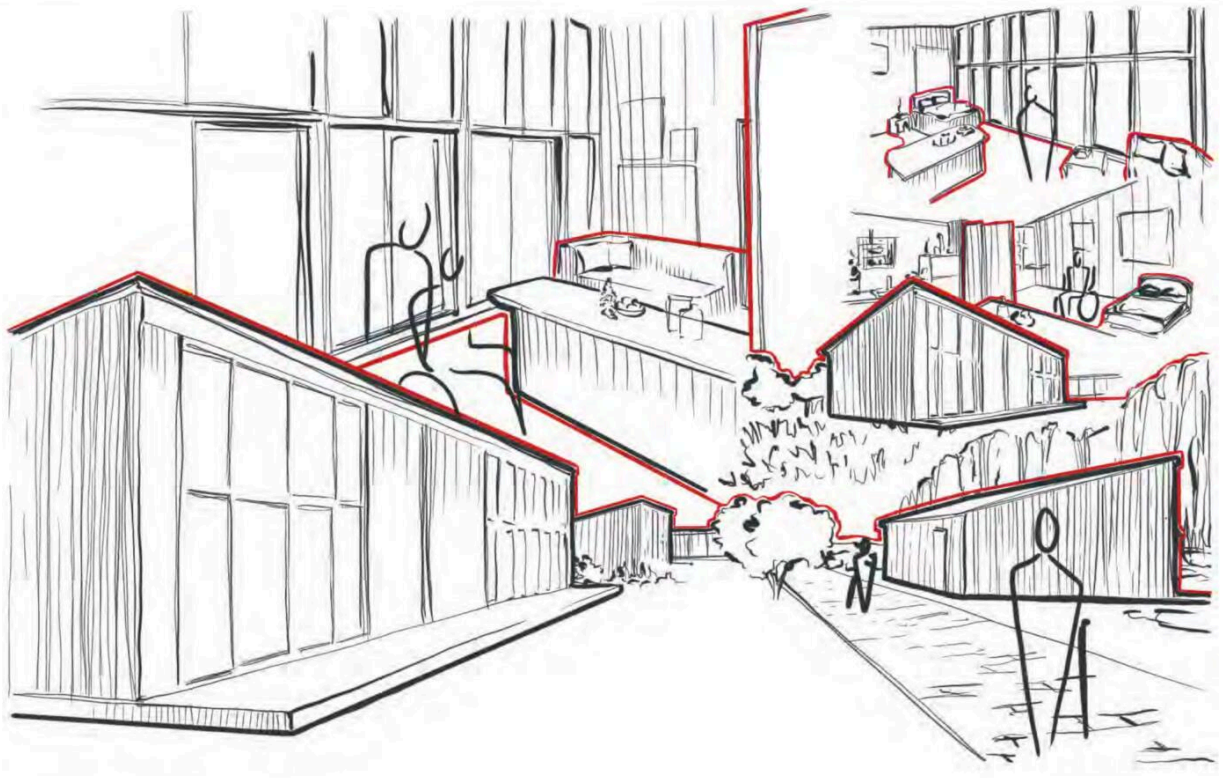

UNDER THE ELDERBERRY

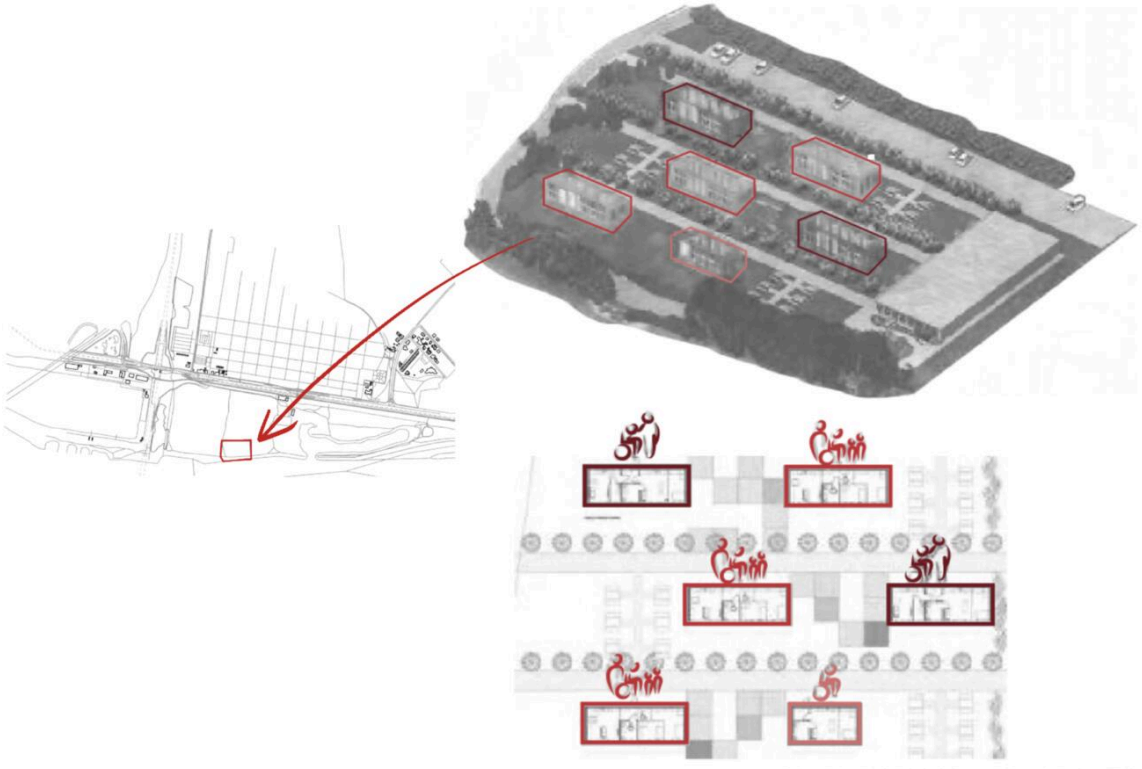

Academic · Housing module · Oder River, Wrocław, Poland · 2nd semester

A complex of modular assisted housing units, located along the Oder River in close proximity to the city center. The site is well connected to public transportation, with tram and bus stops within walking distance. The development is situated in a quiet, low-traffic area while maintaining strong functional and spatial integration with the urban structure.

All buildings are fully accessible and designed in accordance with universal design principles, ensuring usability for people with disabilities. The modular construction system allows for flexible spatial configurations and adaptation to individual user needs. The design enables the integration of an auxiliary residential unit for an assistant adjacent to the primary resident's dwelling, as well as the combination of two modules to form a larger unit suitable for a family with children. Single-occupancy units for residents who do not require assistance are also provided.

The project aims to emphasize the importance of inclusive urban planning by addressing the housing needs of people with disabilities and their assistants within the contemporary urban fabric.

ARCHITECTURE

PHOTOSENSITIVE

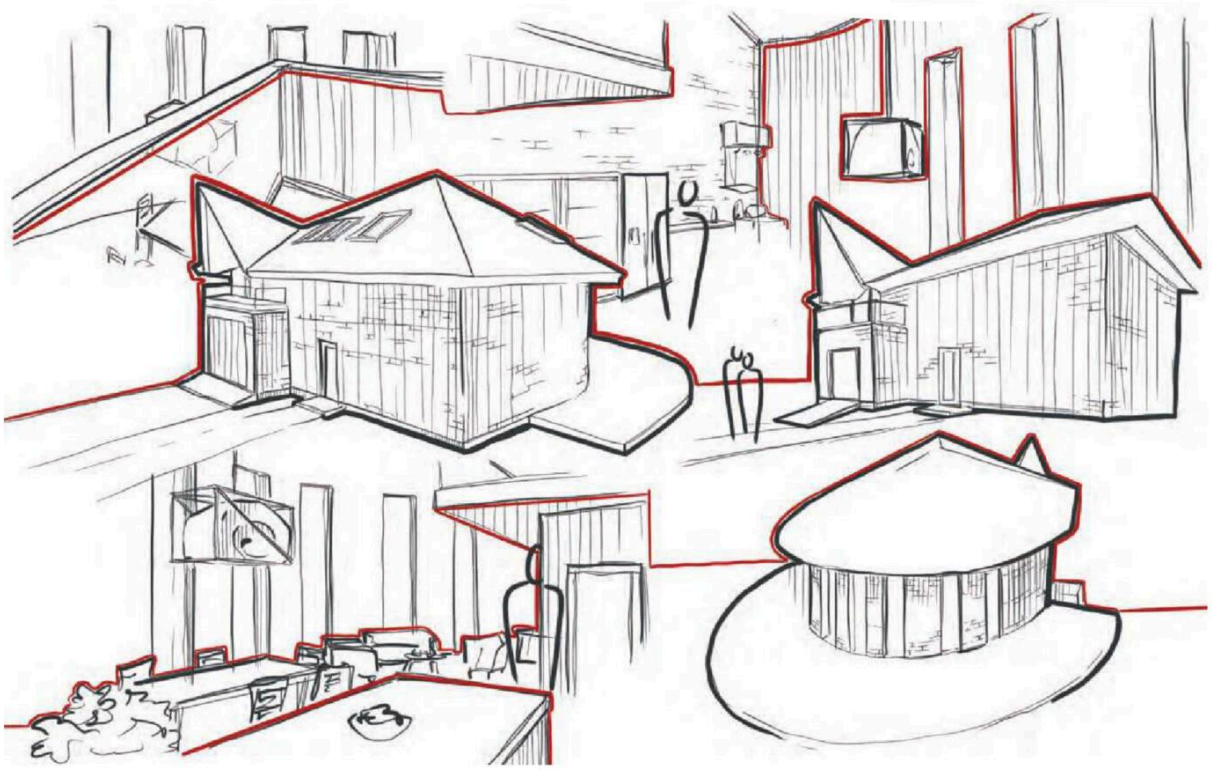

Academic · Single-family house · Wrocław, Poland · 3rd semester

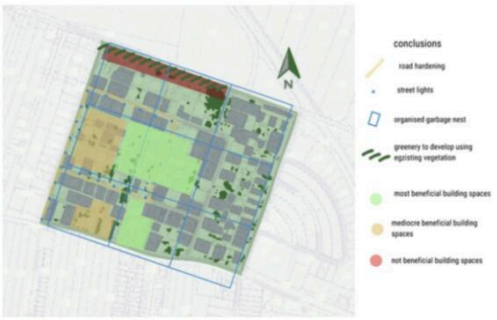

A single-family residential house designed in response to the specific and atypical needs of the homeowner. The client suffers from photophobia, a condition causing significant discomfort when exposed to light, particularly direct sunlight. As a result, the building was conceived to minimize daylight penetration and reduce glare within the interior spaces.

This requirement directly influenced the unconventional orientation of the house. The daytime living zone is located on the northern side of the building, allowing for soft, indirect natural light, while the nighttime private zone is positioned on the southern side and illuminated through relatively small window openings to limit solar exposure. The spatial layout and façade articulation are therefore directly driven by functional and sensory considerations.

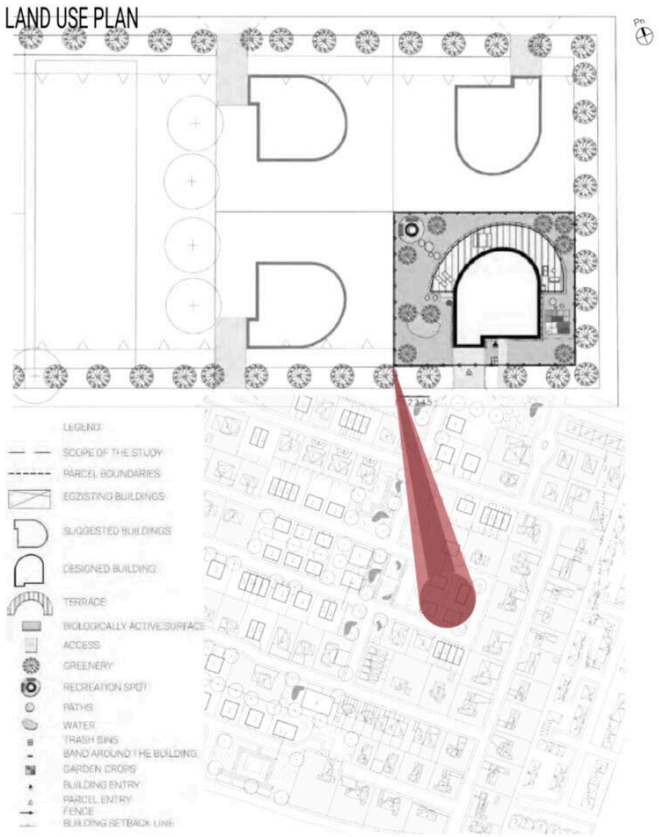

The project also emphasizes the application of the golden ratio in the proportions of the building mass. This principle is echoed in the design of a custom light fixture, which mirrors the geometric form of the house, reinforcing the compositional harmony between the architectural volume and its interior elements.

In line with the concept of reusing materials and extending their lifecycle, the façade is constructed using reclaimed demolition brick. The structural system is traditional, based on load-bearing brick masonry, ensuring durability and material continuity with the external envelope.

ARCHITECTURE

SENSORIUM

Academic · Kindergarten · Stabłowice, Wrocław, Poland · 4th semester

Sensory Kindergarten. Accessible to everyone, regardless of their level of ability.

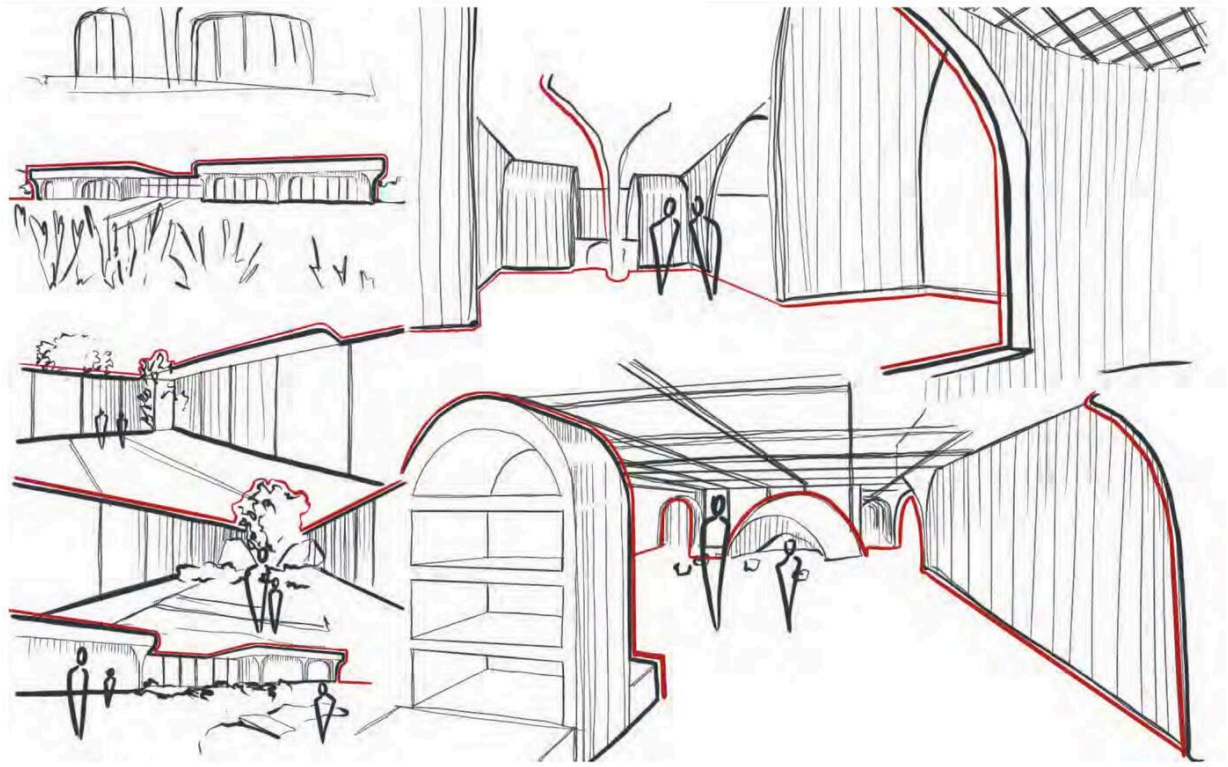

The design emphasizes the child's development through natural and healthy methods: by stimulating their senses through exposure to neutral stimuli.

The kindergarten is equipped with activity rooms, experiential rooms, psychological offices, a speech therapy office, a rehabilitation room, as well as courtyards and quiet zones for rest and relaxation. Part of the facility is also open to the outdoors, allowing children from outside the kindergarten to benefit from its amenities.

The building form refers to the historical context of the housing estate in the surrounding Stabłowice District; however, it is expressed through a contemporary interpretation. This is reflected in the arched shape of the windows.

An important role is also given to the possibility of calming and withdrawing for overstimulated children. Courtyards with sheltered, secluded spaces are provided, and quiet zones are also incorporated within the activity rooms.

The building is fully adapted for people with disabilities.

NURSING HOME

Work · Care facility · Szklarska Poręba, Poland · Work project

A residential care home for the elderly, located in the immediate vicinity of the Izera Mountains. The building is designed in a traditional masonry construction system. It is a two-storey structure without a basement. The ground floor accommodates residential modules for persons with reduced mobility and bedridden residents. It also contains a publicly accessible dining hall with a kitchen back-of-house area, as well as a day-care room for patients who do not require 24-hour care or permanent residence in the facility.

The first floor includes a common room and a medical suite consisting of a doctor's office and a nursing station. The main entrance is visually emphasized with a colored accent to improve wayfinding and spatial orientation for residents.

The architectural form of the building refers to the former German mountain lodge "Dachsbaude," which previously existed on the site, as well as to the regional architectural context of Szklarska Poręba and surrounding mountain shelters.

The project was designed individually, however with supervision and advice from more experienced architects in the studio.

ARCHITECTURE

NEW CELVISKOSA

Academic · Urban design · Jelenia Góra, Poland · Team project

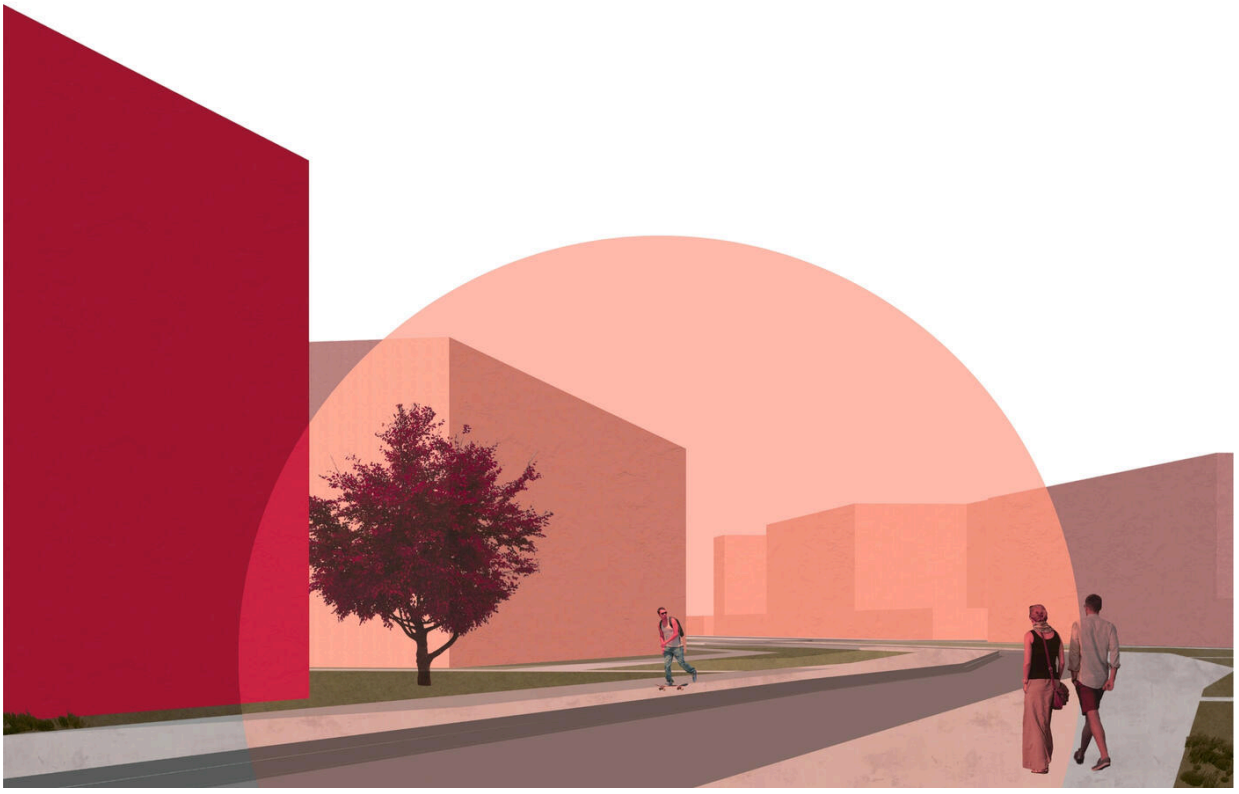

An urban design project located in Jelenia Góra, Poland, in close proximity to industrial areas. Developed collaboratively with Paweł Dąbrowski and Zuzanna Słabicka.

The main objective of the project was to create a welcoming living environment that would encourage people to settle in a city experiencing population decline. An important aspect was also to isolate the proposed development from the busy road and adjacent industrial areas.

An additional access road runs along the length of the site. Its winding layout is intended to reduce vehicle speeds and improve safety. Buildings were designed along the industrial edge to serve as an acoustic barrier, protecting the rest of the development from noise.

One of the key elements of the design is a network of green pedestrian routes connecting the proposed development with existing vegetation and a nearby watercourse. The existing water basin was preserved, restored, and incorporated into the overall spatial structure.

Services and educational facilities were located at strategic points across the site — at both ends and in the central area — strengthening the local community hub.

ARCHITECTURE

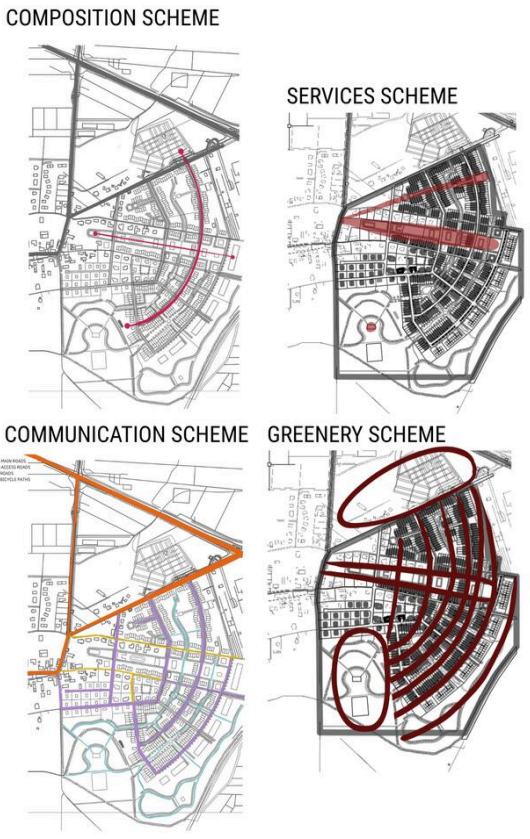

JERZMANOWO

Academic · Urban design · Jerzmanowo, Wrocław, Poland

Urban design project for the development of the Jerzmanowo district in Wrocław, Poland. The main concept was to create a radial spatial structure with clear zoning and a gradual transition in building density and scale. Key radial axes are activated by placing services and amenities along them, creating vibrant public spaces filled with everyday activity. The layout builds upon the existing urban fabric and responds to the site's topography and other existing conditions.

ABOUT BEST CAREER WEEK
From 17 to 21 April 2023 we are organising the 11th edition of BEST Career Week. The event aims to strengthen contact between company representatives and the students and graduates of Wrocław University of Science and Technology, and to present our partners as potential employers.
As part of our cooperation, we offer you a meeting with students, which can take the form of a company visit, a case study, a workshop, a lecture or any other format you propose. We are also happy to help you choose the topics and content of workshops and panel discussions.
In this edition, you have a unique opportunity to take part in:
Networking Day – an event where students, company representatives and the academic community can build relationships in an intimate atmosphere.
Student Consultations – individual meetings where employers and candidates can quickly and effectively discuss employment opportunities, and learn about job offers and the candidates' qualifications.
We guarantee that you will reach a specific target group and that your company will be presented at the highest level. We also invite you to visit our website and Facebook fanpage to learn more about previous editions of the project!
